

## Learning and Teaching with Maple:

Steps:

- some necessary prior knowledge
- understanding the basic problem
- understanding the basic solution algorithm
- Problem 1: nodes without successors / webpages without links
- Problem 2: importance-sinks
- Problem 3: Runtime, Power-Method

### Supposed prior Knowledge:

1.) Discrete Probabilities

2.) Matrix operations: sums, matrix-matrix multiplication, matrix-vector multiplication

ad 1)

Let E be a set of discrete events.

First axiom:  $0 \leq P(e) \leq 1$  for all  $e \in E$ . A Probability is a number between 0 and 1

Second axiom:  $P(\Omega) = 1$ . The probability that some event occurs is 1.

Third axiom: Let  $e(1), \dots, e(n)$  be pairwise disjoint events. Then

$$P(e(1) \cup \dots \cup e(n)) = \sum_{i=1}^n P(e(i)).$$

Example:

Let the results of a mathematical coin-toss be heads or tails.

- event set is {heads, tails} #(dt: Wappen oder Zahl)

- as event space can be chosen

$$\Sigma = \{\{\}, \{\text{heads}\}, \{\text{tails}\}, \{\text{heads or tails}\} = \Omega\}$$

- For the probability measure is then fixed:

$$P(\{\}) = 0,$$

$$P(\{\text{heads}\}) = 1 - P(\{\text{tails}\}),$$

$$P(\Omega) = 1.$$

ad 2)

a) Sum of matrices

The sum of two matrices

$$A =$$

$$\left( a_{ij} \right)_{i=1 \dots m, j=1 \dots n} \text{ and } B = \left( b_{ij} \right)_{i=1 \dots m, j=1 \dots n} \text{ is } C = \left( c_{ij} \right) = \left( a_{ij} + b_{ij} \right)$$

$$\text{Example: } \begin{bmatrix} 44 & -31 \\ 92 & 67 \end{bmatrix} + \begin{bmatrix} 8 & 99 \\ 69 & 29 \end{bmatrix} = \begin{bmatrix} 52 & 68 \\ 161 & 96 \end{bmatrix}$$

b) Multiplication of two matrices

The product of two matrices

A=

$$(a_{ij})_{i=1 \dots m, j=1 \dots n} \text{ and } B = (b_{ij})_{i=1 \dots n, j=1 \dots o} \text{ is } C = (c_{ij}) = \left( \sum_{k=1}^n (a_{ik} + b_{kj}) \right)$$

$$\text{Example: } \begin{bmatrix} 44 & -31 \\ 92 & 67 \end{bmatrix} \cdot \begin{bmatrix} 8 & 99 \\ 69 & 29 \end{bmatrix} = \begin{bmatrix} (44 \cdot 8 - 31 \cdot 69) & (44 \cdot 99 - 31 \cdot 29) \\ (92 \cdot 8 + 67 \cdot 69) & (92 \cdot 99 + 67 \cdot 29) \end{bmatrix}$$

c) is a special case of b)

## The google problem, the basic problem:

given is

- a library with 25 billion documents
- no centralized organisation
- no librarians
- anyone can add documents

You are interested in information. You only know some keywords, and a further complication is:

Google claims **more than 25 billion indexed pages**. **95% of the text** in the Web is composed of **only some 1,000 words**. How can we distinguish the important pages from the unimportant ones?

**Impossible?**

**The basic algorithm:** The heart of the google software is the PageRank algorithm.

Let  $P$  be a web page.  
 We call  $\text{Imp}(P)$  the importance of  $P$ .

Let  $P_j$  have  $L_j$  many outgoing links to other pages.  
 If  $P_i$  is such a target-page,  $P_j$  will pass  $1/L_j$  „importance“ to  $P_i$ .

Let  $B_i$  be the set of pages linking to  $P_i$ . Then the importance relation between a page and its neighbours is as follows:

$$\text{Imp}(P_i) = \sum_{P_j \in B_i} \frac{\text{Imp}(P_j)}{L_j}; \# ?? \text{ chicken vs. egg problem}$$

Next step: define a matrix  $H = (h_{ij})$  with

$$h_{ij} := \begin{cases} \frac{1}{L_j}, & \text{if } P_j \in B_i \\ 0, & \text{otherwise} \end{cases}$$

Example:  $B_7 = \{6\} \rightarrow L_6 = 2 \rightarrow$  line 7:  $(0,0,0,0,0,1/2,0)$

$B_5 = \{1,2,6,7\} \rightarrow L_1 = 2, L_2 = 1, L_6 = 2, L_7 = 1 \rightarrow$  line 5:  $(1/2,1,0,0,0,1/2,1)$

Then  $H =$

$$\begin{bmatrix} 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 1 & 0 & 0 & 0 & \frac{1}{2} & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 0 \end{bmatrix}$$

$\cdot Imp$

and with a vector  $Imp$  of pageranks, e.g.  $Imp =$

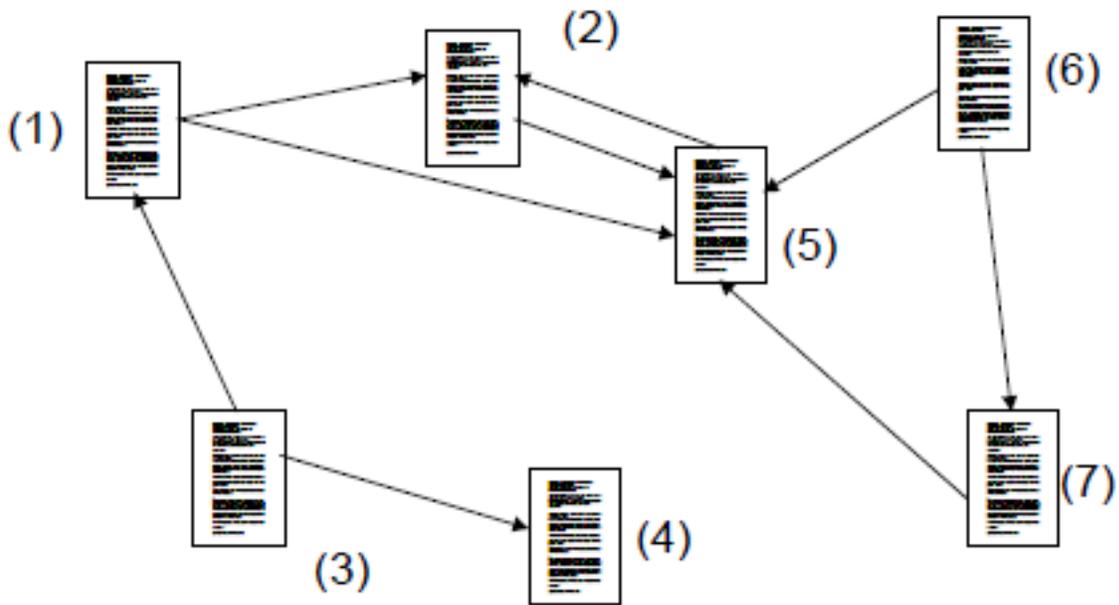

$$\begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}$$

it is valid:  $Imp = H$

$$> H := \begin{bmatrix} 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 1 & 0 & 0 & 0 & \frac{1}{2} & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 0 \end{bmatrix}$$

:  $Imp :=$

$$\begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} : \#$$

>  $Imp, \quad H.Imp, \quad \# \text{ check that } Imp = H \cdot Imp$

$$\begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}$$

(2)

We saw:

a correct PageRank assignment can be interpreted as the eigenvector  $Imp$  of a matrix

$H$  with eigenvalue 1, such that  $Imp = 1 \cdot H \cdot Imp$ :

**Problem 1:** Unfortunately,  $H$  contains so called dangling nodes, i.e. nodes without successors.

Consequence: zero-columns  $\Rightarrow H$  not stochastic  $\Rightarrow$  possibly no stationary solution

>  $(\text{eigenvalues}, \text{eigenvectors}) := \text{LinearAlgebra}[\text{Eigenvectors}](H);$

$$\text{eigenvalues, eigenvectors} := \begin{bmatrix} -1 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 & -2 & 0 & 0 & 0 \\ -1 & 1 & -1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 \end{bmatrix} \quad (3)$$

v is a vector of eigenvalues, e the matrix of all eigenvectors. The i-th eigenvalue corresponds to the i-th eigenvector.

-> good luck. Matrix H has a solution.

Control:

> *Imp := Column(eigenvectors, [2]); #remember: we are looking for an Imp with  $Imp = H * Imp$*

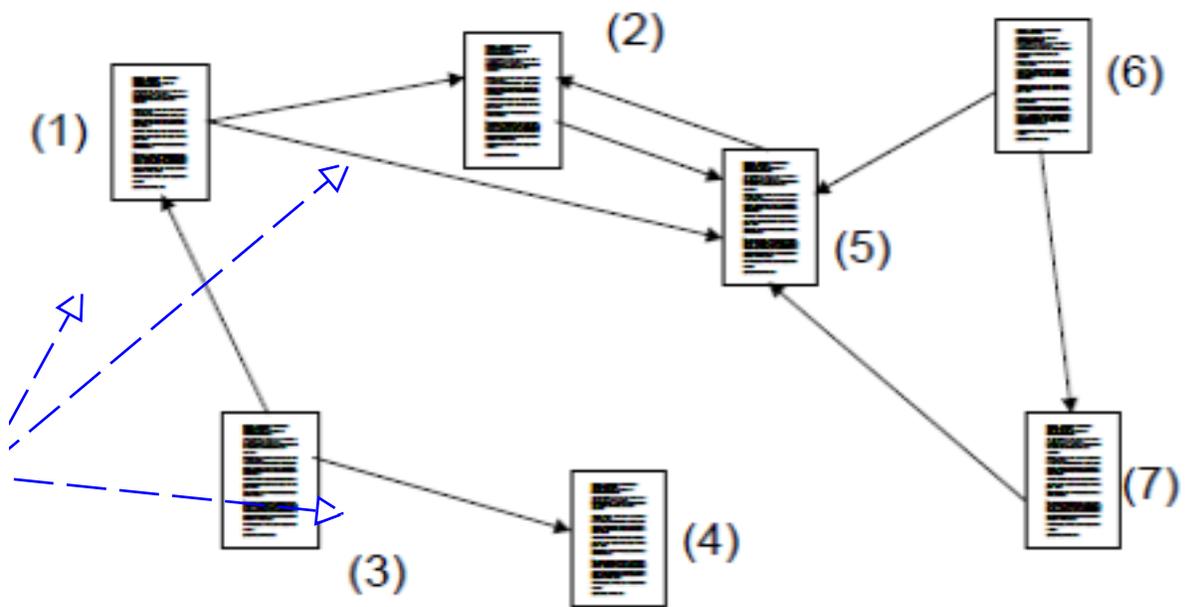

$$Imp := \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} \quad (4)$$

> *H.Imp, Imp*

$$\begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} \quad (5)$$

Now, let A be the matrix whose entries are all zero except for the columns of the dangling nodes, in which each entry is 1/n, n being the number of nodes. Let  $S := H + A$ .

$$\begin{aligned}
 & \text{> } A := \begin{bmatrix} 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 \end{bmatrix} : S := H + A : \# \text{ ``}
 \end{aligned}$$

> H, A, S;

$$\begin{bmatrix} 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 1 & 0 & 0 & 0 & \frac{1}{2} & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & \frac{1}{2} & \frac{1}{7} & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 0 & 0 & \frac{1}{7} & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & \frac{1}{7} & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 1 & 0 & \frac{1}{7} & 0 & \frac{1}{2} & 1 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{7} & 0 & \frac{1}{2} & 0 & 0 \end{bmatrix} \quad (6)$$

Now, for each column of S is valid that the entries of each column sum up to one. This guarantees the existence of a stationary vector. (*No proof here, but there exists*

*a Theorem.*) S is called a "stochastic matrix".

--> New interpretation: there is a random surfer on the web. Which portion of time will he spend

in which node, if she decides her next jump concerning transition-probabilities as they are described in the matrix S?

Let us take a look at the solution with the help of matrix S:

> `(eigenvalues, eigenvectors) := LinearAlgebra[Eigenvectors](S);`

$$\text{eigenvalues, eigenvectors} := \begin{bmatrix} \frac{1}{14} + \frac{1}{14} \sqrt{15} \\ \frac{1}{14} - \frac{1}{14} \sqrt{15} \\ -1 \\ 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} \dots \\ \dots \\ \dots \\ \dots \\ \dots \\ \dots \\ \dots \end{bmatrix} \quad (7)$$

$$-\frac{1}{2025} \frac{1}{\left(\frac{1}{14} + \frac{1}{14} \sqrt{15}\right)^2 \left(-\frac{13}{14} + \frac{1}{14} \sqrt{15}\right)} \left( \left(2301 \left(\frac{1}{14} + \frac{1}{14} \sqrt{15}\right)\right)^3 \right.$$

$$\left. - 166 \left(\frac{1}{14} + \frac{1}{14} \sqrt{15}\right)^2 - \frac{247}{14} - \frac{65}{14} \sqrt{15}\right) \sqrt{15},$$

$$\frac{1}{2025} \frac{1}{\left(\frac{1}{14} - \frac{1}{14} \sqrt{15}\right)^2 \left(-\frac{13}{14} - \frac{1}{14} \sqrt{15}\right)} \left( \left(2301 \left(\frac{1}{14} - \frac{1}{14} \sqrt{15}\right)\right)^3 \right.$$

$$\left[ \begin{array}{c} 1, 1, 0, 1, 0, 0, 0 \end{array} \right]$$

> *Imp := Column(eigenvectors, [7]), S.Imp;*  
*# eigenvectors build a matrix. We need the last column!*

$$Imp := \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}$$

(8)

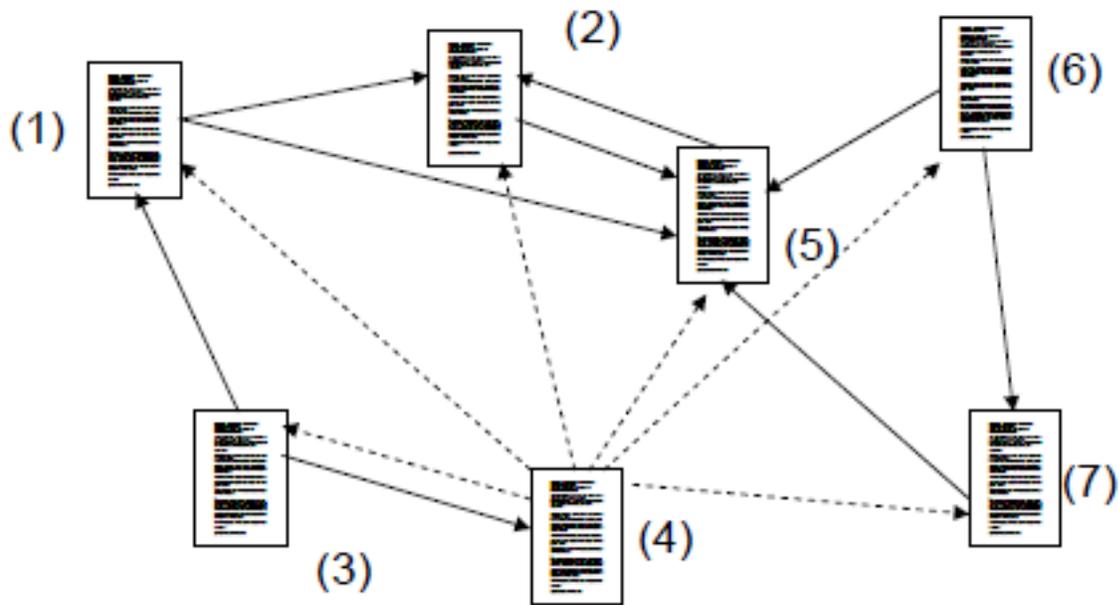

If Imp is a solution to our problem, then also 1/2\*Imp is a solution:  $H * (1/2 * Imp) = 1/2 * Imp$

>  $\frac{1}{2} \cdot Imp,$

$$\begin{bmatrix} 0 \\ \frac{1}{2} \\ 0 \\ 0 \\ \frac{1}{2} \\ 0 \\ 0 \end{bmatrix}$$

(9)

>

Unfortunately, there is **Problem 2:**

The nodes (2) and (5) are "importance sinks".

-> In the graph, you see that the random walker is trapped

-> The graph is said to be "not strongly connected". It does not exist a path from any node to any other node.

-> The matrix is not "irreducible", i.e. S can be written in block form:  $S = \begin{bmatrix} * & 0 \\ * & * \end{bmatrix}$ .

**Strongly connected graphs produce irreducible matrices.**

*(No proof here, but there exists a Theorem.)*

$$> E := \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \end{bmatrix};$$

$$E := \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 \end{bmatrix} \quad (10)$$

>  $G := \frac{85}{100} \cdot S + \left(1 - \frac{85}{100}\right) \cdot \frac{1}{7} \cdot E$ , #  $\frac{I}{7}$  because we have 7 nodes --  
 → there is a bit connection between all pairs of pages

$$G := \begin{bmatrix} \frac{3}{140} & \frac{3}{140} & \frac{25}{56} & \frac{1}{7} & \frac{3}{140} & \frac{3}{140} & \frac{3}{140} \\ \frac{25}{56} & \frac{3}{140} & \frac{3}{140} & \frac{1}{7} & \frac{61}{70} & \frac{3}{140} & \frac{3}{140} \\ \frac{3}{140} & \frac{3}{140} & \frac{3}{140} & \frac{1}{7} & \frac{3}{140} & \frac{3}{140} & \frac{3}{140} \\ \frac{3}{140} & \frac{3}{140} & \frac{25}{56} & \frac{1}{7} & \frac{3}{140} & \frac{3}{140} & \frac{3}{140} \\ \frac{25}{56} & \frac{61}{70} & \frac{3}{140} & \frac{1}{7} & \frac{3}{140} & \frac{25}{56} & \frac{61}{70} \\ \frac{3}{140} & \frac{3}{140} & \frac{3}{140} & \frac{1}{7} & \frac{3}{140} & \frac{3}{140} & \frac{3}{140} \\ \frac{3}{140} & \frac{3}{140} & \frac{3}{140} & \frac{1}{7} & \frac{3}{140} & \frac{25}{56} & \frac{3}{140} \end{bmatrix} \quad (11)$$

> (eigenvalues, eigenvectors) := LinearAlgebra[Eigenvectors](G) :

> eigenvalues;

$$\begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ -\frac{17}{20} \\ \frac{17}{280} + \frac{17}{280} \sqrt{15} \\ \frac{17}{280} - \frac{17}{280} \sqrt{15} \end{bmatrix} \quad (12)$$

>  $Imp := \text{Column}(\text{eigenvectors}, [1]), G.Imp;$

$$Imp := \begin{bmatrix} 1 \\ \frac{139559}{12654} \\ \frac{40}{57} \\ 1 \\ \frac{147413}{12654} \\ \frac{40}{57} \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ \frac{139559}{12654} \\ \frac{40}{57} \\ 1 \\ \frac{147413}{12654} \\ \frac{40}{57} \\ 1 \end{bmatrix}$$

### Problem 3: Runtime, Power method

The next question is, how we can compute the solution as fast as possible. The idea of the so called power method is to use the fact that under certain circumstances the sequence  $Imp^0 = a$  and  $Imp^{(k+1)} = G \cdot Imp^k$  converges to the correct solution.

It will do so, if the matrix  $G$  is irreducible and stochastic. (*There is a Theorem, no proof here*)

>  $Start := \left\langle \frac{1}{7}, \frac{1}{7}, \frac{1}{7}, \frac{1}{7}, \frac{1}{7}, \frac{1}{7}, \frac{1}{7} \right\rangle;$

$$Start := \begin{bmatrix} \frac{1}{7} \\ \frac{1}{7} \\ \frac{1}{7} \\ \frac{1}{7} \\ \frac{1}{7} \\ \frac{1}{7} \\ \frac{1}{7} \end{bmatrix}$$

(14)

>  $G.Start,$

$$\begin{bmatrix} \frac{39}{392} \\ \frac{433}{1960} \\ \frac{19}{490} \\ \frac{39}{392} \\ \frac{79}{196} \\ \frac{19}{490} \\ \frac{39}{392} \end{bmatrix}$$

(15)

>  $G^2.Start, \# = (G.G).Start = G.(G.Start)$

$$\begin{bmatrix} \frac{13717}{274400} \\ \frac{45923}{109760} \\ \frac{1839}{54880} \\ \frac{13717}{274400} \\ \frac{200103}{548800} \\ \frac{1839}{54880} \\ \frac{13717}{274400} \end{bmatrix}$$

(16)

>  $seq(evalf(G^k.Start), k=8..11);$

(17)

$$\begin{bmatrix} 0.03693512985 \\ 0.4239101952 \\ 0.02591652167 \\ 0.03693512985 \\ 0.4134513719 \\ 0.02591652167 \\ 0.03693512985 \end{bmatrix}, \begin{bmatrix} 0.03692807319 \\ 0.3930446478 \\ 0.02591355148 \\ 0.03692807319 \\ 0.4443440297 \\ 0.02591355148 \\ 0.03692807319 \end{bmatrix}, \begin{bmatrix} 0.03692595398 \\ 0.4192995509 \\ 0.02591269460 \\ 0.03692595398 \\ 0.4180971979 \\ 0.02591269460 \\ 0.03692595398 \end{bmatrix}, \begin{bmatrix} 0.03692533247 \\ 0.3969885859 \\ 0.02591243727 \\ 0.03692533247 \\ 0.4404105421 \\ 0.02591243727 \\ 0.03692533247 \end{bmatrix}$$

(17)

> seq( evalf( G<sup>k</sup>.Start ), k= 100 ..103);

$$\begin{bmatrix} 0.03692507018 \\ 0.4072408675 \\ 0.02591232995 \\ 0.03692507018 \\ 0.4301592621 \\ 0.02591232995 \\ 0.03692507018 \end{bmatrix}, \begin{bmatrix} 0.03692507018 \\ 0.4072408576 \\ 0.02591232995 \\ 0.03692507018 \\ 0.4301592720 \\ 0.02591232995 \\ 0.03692507018 \end{bmatrix}, \begin{bmatrix} 0.03692507018 \\ 0.4072408660 \\ 0.02591232995 \\ 0.03692507018 \\ 0.4301592636 \\ 0.02591232995 \\ 0.03692507018 \end{bmatrix}, \begin{bmatrix} 0.03692507018 \\ 0.4072408588 \\ 0.02591232995 \\ 0.03692507018 \\ 0.4301592707 \\ 0.02591232995 \\ 0.03692507018 \end{bmatrix}$$

(18)

Last but not least: what about matrices with 25 billion rows and columns?

→ Remember : S = H + A

$$\text{therefore : } G = 0.85 \cdot H + 0.85 \cdot A + \frac{(1 - 0.85)}{n} \cdot E$$

$$\text{therefore : } \text{Imp}^{k+1} = G \cdot \text{Imp}^k = 0.85 \cdot H \cdot \text{Imp}^k + 0.85 \cdot A \cdot \text{Imp}^k + \frac{(1 - 0.85)}{n} \cdot E \cdot \text{Imp}^k$$

now : most entries of H are zero. The rows of A are all the same, **and** the rows of E are all the same

therefore : In practice only about 300 billion operations.

>

### Prüfungsdetails

- ca. 4 Wochen vor Semesterende wird es ein Testats-Übungsblatt geben
  - Prüfungsmodalitäten werden genau spezifiziert auf dem Blatt
  - Lösungen müssen in den beiden verbleibenden Übungen vorgestellt werden
  - Lösungen müssen englische Kommentare enthalten
  - Lösungen müssen per email an [lorenz@mathematik.tu-darmstadt.de](mailto:lorenz@mathematik.tu-darmstadt.de) gesendet werden, und zwar mit dem Subject [IMS2010] und dem Inhalt  
Matrikelnummer1  
Matrikelnummer2  
...
- und im Anhang: das .mw Maple-file
